

LIGHT PIPE

LIGHT PIPE

Daylight system with Fresnel cross

The LIGHT PIPE is an innovative daylight system. It offers the possibility of conducting natural light from the outside down into rooms, in order to use the bright, environmentally friendly and especially pleasant light of the sun optimally. The Fresnel fade-out blades in the top section of the daylight pipe ensure an even level of lighting. The LIGHT PIPE is primarily used in halls, in buildings with large rooms and in areas without any daylight.

As a supplement to daylight control, the LIGHT PIPE can, for example, also be used for the integration of exterior artificial light or, alternatively, for the simulation of daylight.
