

LIGHT PIPE

LIGHT PIPE

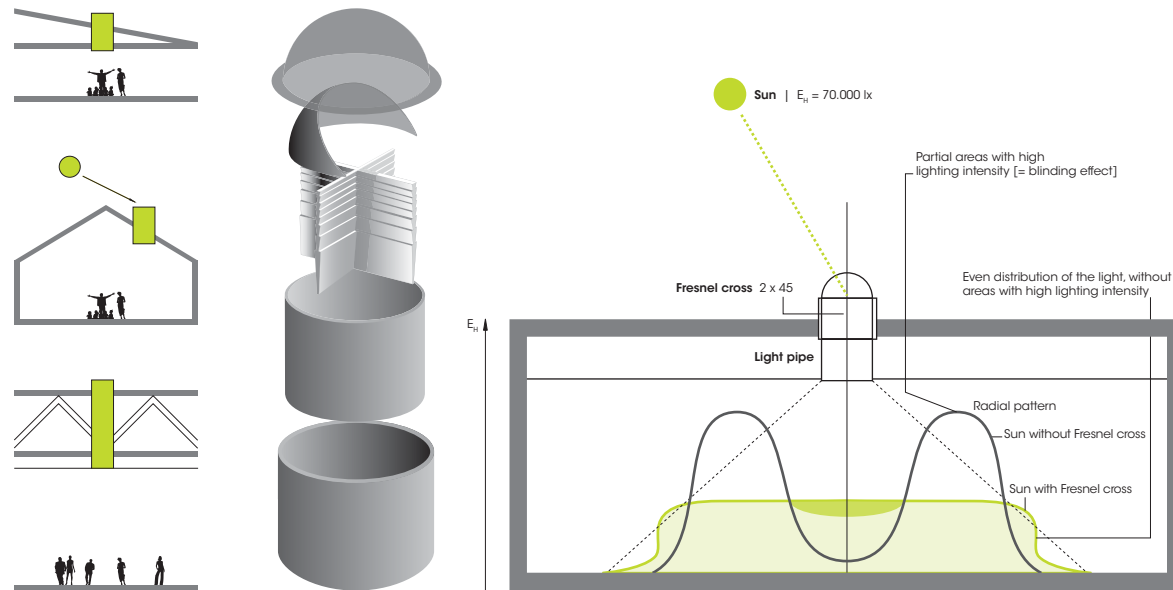

Daylight system with Fresnel cross

The LIGHT PIPE is an innovative daylight system. It provides the opportunity to steer natural light with easy means, to fade out at the same time and thereby to light up ecologically friendly. The Fresnel fade-out blades in the top section of the daylight pipe ensure an even level of lighting. The LIGHT PIPE is primarily used in halls, in buildings with large rooms and in areas without any daylight.

As a supplement to daylight control, the LIGHT PIPE can, for example, also be used for the integration of exterior artificial light or, alternatively, for the simulation of daylight. [Standard dimensions: Ø1 000 mm; pipe length: 1 000 mm; material: DUROPLAN® A400, if indicated cladding powder coated or E6EV1].

Benefits

- Natural and energy-efficient lighting
- Homogenous lighting levels even when the sun is shining
- Good fading-out
